## Comparing Slopes and Intercepts

### Lesson Question

### Lesson Goals

**Analyze** linear functions expressed in different forms.

**Determine**  and  $y$ -intercepts of linear functions.

**Compare** characteristics of  functions.

### Words to Know

Fill in this table as you work through the lesson. You may also use the glossary to help you

	to find the place of something
	the ratio of the change in the dependent values (outputs) to the change in the independent values (inputs) between two points on a line
	the $y$ -coordinate of the point where the graph of a line crosses the $y$ -axis
	a function that can be written in the form $y = mx + b$ , where $m$ and $b$ are real numbers; consists of a set of ordered pairs all lying on the same line

Warm-Up

Comparing Slopes and Intercepts

Reviewing Ways to Represent a Linear Function

Graph

x	y
-2	5
-1	2
0	-1
1	-4

(-2, 5)

$y = \boxed{\phantom{000}} + b$

$y = -3x + 17$

$y = 4x - 0.15$

$y = -x$

Equations

## Comparing Slopes and Intercepts

Slide

2

### Linear Function Representations

A linear function has a **slope** of  $-\frac{1}{3}$  and a **y-intercept** of 2.

x	y
-1	$2\frac{1}{3}$
0	2
1	$1\frac{2}{3}$

$$y = -\frac{1}{3}x + 2$$

$$y = mx + \boxed{\phantom{00}}$$

**Equation**

**Graph**

4

### Comparing the Slopes

Up or Down (sign of the slope)

- slopes trend upward: y increases as x increases, left to right.
- Negative slopes trend : y decreases as x increases, left to right.

# Instruction

## Comparing Slopes and Intercepts

Slide

4

Steepness (absolute value of the slope)

- Larger slope means a  line (consider only the number, not the sign).
- Slope close to zero means it is  to horizontal.

7

### Finding the y-Intercept

EXAMPLE

- **Locate** the y-intercept of the linear function represented in the graph.
- **Locate** the y-intercept of the linear function represented in an equation written in slope- form.

$$y = mx + b$$

$$b = \text{[ ]}$$

$$y = \text{[ ]} + 4$$

- Which function has a larger y-intercept?

The  is the function that has the larger y-intercept.

Slide

10

### Representing Slopes of Linear Functions

EXAMPLE

	x	y
	-4	-14
	-1	-5
1	1 $x_1$	1 $y_1$
2	3 $x_2$	7 $y_2$
	8	22

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\boxed{\phantom{00}} - 1}{3 - \boxed{\phantom{00}}} = \frac{6}{2} = 3$$

- Find the slope of the linear function from data in the table.

$$m = \boxed{\phantom{00}}$$

- Find the slope of the linear function expressed in the graph.

$$m = \boxed{\phantom{00}}$$

- Compare the slopes.

Both are  $\boxed{\phantom{00}}$ .

So, the slope of  $m = 3$  is the  $\boxed{\phantom{00}}$  function.

- Compare the two linear functions.

The function represented in the  $\boxed{\phantom{00}}$  is positive and has a steeper slope than the function represented in the  $\boxed{\phantom{00}}$ .

Slide

12

## Representing Intercepts of Linear Functions

## EXAMPLE

Compare the two linear functions.

$x$	$y$
-4	-14
-1	-5
1 $x_1$	1 $y_1$
3 $x_2$	7 $y_2$
8	22

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{7 - 1}{3 - 1} = \frac{\boxed{\phantom{000}}}{2} = \boxed{\phantom{000}}$$

$$1 = 3(1) + b$$

$$1 = 3 + b$$

$$b = \boxed{\phantom{000}}$$

- Find the y-intercept of the linear function from the data in the table.

$$b = \boxed{\phantom{000}}.$$

- Find the y-intercept of the linear function expressed in the graph.

$$b = \boxed{\phantom{000}}.$$

- Which function has a larger y-intercept?

Negative 1 is larger than negative 2, so the  $\boxed{\phantom{000}}$  function has the larger y-intercept.

# Summary

## Comparing Slopes and Intercepts

### Lesson Question

How can you determine the characteristics of linear functions that are represented in different ways?

### Answer

### Review: Key Concepts

A linear function with the same slope and y-intercept can be  in different ways.

A linear function has a slope of 2 and a y-intercept of -3.

x	y
-2	-7
0	-3
2	1

$$y = 2x - 3$$

$$y = \text{} + b$$

$$m = \frac{4}{2} = \text{}$$
